Remote Access to Computer Science Computing Labs

Full graphical desktop access to the CSIL and CSTL computing labs is available remotely for the Spring quarter.

A connection to the Campus "Pulse Secure" VPN Service is required to make remote desktop connections to our computing labs. In addition, you will need to authenticate on the remote lab computer using your College of Engineering account.

To access the lab computers remotely, follow the instructions below for your operating system.

- Windows (classic RDP client)
- Windows (modern RDP client)
- MacOS
- Linux

If you are having issues using the Campus VPN, installing/configuring your RDP client, or are unable to use the remote access service, please consult the FAQ and/or send an email to help@engineering.ucsb.edu

Thank you,

Engineering Computing Infrastructure
